Remember: More than 5% means the specimen is contaminated or degraded and should not be used.

Just like food with mold or maggots, such a sample should not be used.

The table shows the math: 7.7% degraded epitestosterone.

According to WADA protocol, since the epitestosterone level exceeds 5% (it is 7.7%) the specimen should not have been evaluated for an adverse analytic finding.

It should have stopped here.
